remove del option

Ran a command, shared files

I removed the Del button from each row and deleted the `deleteItem` function from `script.js`, so only Edit remains. Replace your existing `script.js` with the updated file. The other files don't need changes. The delete action is still in the Apps Script backend, but nothing in the page can call it now.

FMD micro plan-9th round final.xlsx
XLSX

i want fetch detail from column A B DE J of google sheet in to html sheet with search option of editable option for column D E J of google sheet

Ran 6 commands, created 2 files, and 2 more tools

The page now loads columns A, B, D, E and J from your Google Sheet, with search and editing for D, E and J. I haven't run it against your live Google Sheet. I only checked the row-reading logic against your uploaded xlsx, which gave 694 owners and 1,748 ear tags.

How to set it up

1. Open your Google Sheet, go to Extensions → Apps Script, and paste in `FMD_AppsScript.gs`.
2. Choose Deploy → New deployment → Web app, set "Execute as: Me" and "Access: Anyone", then copy the URL.
3. Paste that URL into `SCRIPT_URL` in `script.js`. Leave `SHEET_NAME` empty to use the first tab, or enter the exact tab name.
4. Host `index.html`, `script.js` and `style.css` together.

What it does

- **Layout:** each owner row shows Sl No, name, Aadhaar and mobile. The animal rows below an owner show only the ear tag, as in your sheet.
- **Search:** it matches owner name, Sl No, Aadhaar, mobile and ear tag. When you search, the animal rows show the owner's name beside them.
- **Editing:** Edit opens a form. On an owner row you can change Aadhaar, mobile and ear tag. On an animal row you can change only the ear tag. Aadhaar must be 12 digits and mobile 10 digits. The sheet updates straight away.
- **Page headers:** your sheet repeats the title and header block every page, and the script skips those rows. Some serial numbers also restart, so Sl No can repeat.
- **Conflict check:** before saving, the script checks that nobody changed the row since you loaded it. If they did, it asks you to refresh instead of overwriting.
- **Passcode (optional):** your sheet has Aadhaar numbers, and "Access: Anyone" lets anyone with the URL read them. Setting `ACCESS_CODE` in the script makes the page ask for a passcode. I'd suggest setting it.

Sheet position: edits are matched by sheet row number, so adding or deleting rows in the sheet while the page is open can shift things. Click Refresh after structural changes. The conflict check should catch a mismatch.

Download all

want add new eartag to particular owner

Ran a command, shared files

Each owner row now has a green **+ Tag** button next to Edit. I only syntax-checked the code and haven't run it against your Google Sheet.

How it works

1. Click **+ Tag** on an owner and enter the new ear tag number.
2. If the owner has no ear tag yet, the tag goes into column J of the owner's own row.

3. Otherwise a new row is inserted right after that owner's last ear tag, with the tag in column J.
4. The page reloads the list afterwards, because inserting a row shifts the sheet row numbers.

Checks before saving

- The tag must be at least 8 digits.
- A tag that already exists anywhere in the sheet is rejected, and the message gives the sheet row.
- If the owner's name at that row has changed since you loaded the page, it asks you to refresh.

Animal count: your animal rows also carry a count of 1 under cattle, buffalo or calves in columns F to I. The form has a checkbox, ticked by default, that copies those counts from the owner's previous tag row. Untick it if you only want the tag added. Without the copy, the new animal won't appear in your cattle and buffalo totals.

Totals: your sheet has SUM totals at the bottom of each page block. If you add a tag to the last owner of a block, the new row may fall just outside that SUM range, so check that total once.

Replace all four files, and in Apps Script paste the new `FMD_AppsScript.gs` and deploy it as a new version, otherwise the add action won't work.

VD hor Charge list.xlsx

XLSX

i want to display all the data from sheet in html sheet as with edit option for each column and add option to each tab

Ran 5 commands ▸

I've finished writing the app. Next I'm checking the tab layout and row detection against your workbook, then I'll hand over the files.

Ran a command, shared files ▸

I built a separate page for this workbook: one tab button per sheet, every row shown, an **Edit** button on each row and an **+ Add** button on each tab. I haven't run it against your live Google Sheet. I checked the column headings and row detection against your uploaded xlsx, and the code passes a syntax check.

Left out on purpose: the `Credential`, `webapp` and `vaccinator code` tabs are not sent to the page. They hold logins and passwords and the links to your other web apps, and a public web app would expose them to anyone with the URL. If you really want them, remove them from `EXCLUDE_TABS` in the `.gs` file. I'd advise against it.

How it works

- **Setup:** it's the same as before. Paste `VD_Horala_AppsScript.gs` into the sheet's Apps Script and deploy it as a new web app. Then put its URL in `script.js` and host the three web files together. It is in its own `vd-horala` folder so it doesn't overwrite your FMD files.
- **Edit:** the form shows every column of that row, and you can change any of them. Sl No columns that are formulas (in `Regi` and `file`) are shown greyed out and can't be edited, so the numbering formulas stay intact.
- **Add:** a new row goes right after the last numbered row, above the "Handed over / taken over the charges" note lines. Sl No is filled automatically, and the row copies the formatting of the row above it.
- **Search:** each tab has its own search box.
- **Conflict check:** an edit is refused if someone else changed the same cell since you loaded the page.
- **Text kept as typed:** values like `10/1995` or `1 vol 2` are saved as text, so Sheets won't turn them into dates.
- **Passcode:** your sheet has employee details, so I'd set `ACCESS_CODE` in the script. The page then asks for it once per session.

Notes

- The note lines under the numbered rows (like "Handed over the charges to Dr…") appear in grey italics.
- `Furn` has one stray value in H25 outside the table. It isn't shown.

Download all

will it Automatically fetches details if i add new tab

Checking how the tabs list refreshes on reload.

Yes. The page asks the sheet for its list of tabs every time it loads, so a new tab shows up as a new button after you reload the page. You don't need to change the code or redeploy the Apps Script. The **Refresh** button reloads only the tab you're on, so use a full page reload to pick up a new tab.

For the new tab to display properly:

- **Layout:** it should follow the same layout as your current tabs, with the title in row 1, the column headings in row 2 (or rows 2 and 3), and data from row 4 down. If its headings are somewhere else, add a line for it in `LAYOUTS` in the `.gs` file, and redeploy the Apps Script after that change.
- **Columns:** the page shows every column that has a heading, so a column with no heading is left out.
- **Skipped tabs:** hidden tabs and tabs named in `EXCLUDE_TABS` never appear.
- **Sl No:** if the new tab's first column has numbers in the rows (1, 2, 3…), the **+ Add** button fills in the next number automatically. If it has no numbers, you type every column yourself and the row goes after the last filled row.

instead of searching particular tab , i want to search all the tab, so i can easily identify and edit

Ran 4 commands, shared files ▸

The search box now searches every tab at once. I tested the search and highlighting with sample data in a quick script, but not against your live sheet.

- **Results:** matches are grouped under the name of the tab they came from, with the number of matches next to it. The words you typed are highlighted in yellow.

- **Several words:** a row must contain all the words you type. For example, “board meeting” finds rows containing both words, even if they are in different columns.
- **Editing:** every result row has its own **Edit** button, so you can fix it right there without switching tabs. After saving, the results update with the new value.
- **Going to a tab:** click a tab’s name in the results, or clear the search box, to see that whole tab.
- **Add:** the **+ Add** button is turned off while a search is active, because it would otherwise be unclear which tab the new row goes into. Clear the search, pick a tab, then add.
- **Loading:** the page now loads every tab when it opens, so the first load takes a bit longer. After that, switching tabs and searching are instant, with no waiting on the sheet.
- **Refresh: Refresh** now reloads all tabs, so a newly added tab also shows up without reloading the whole page.

Replace all four files. In Apps Script, paste the new `VD_Horala_AppsScript.gs` and deploy it as a new version, because the “load all tabs” step needs the updated backend.

will accidental delete of any tab affect the working of web app

Working out what errors deleted tabs cause ▸

No, a deleted tab won’t break the web app. It reads the list of tabs from the sheet every time the page loads, so a deleted tab just disappears from the tab bar and from search results.

- **Page already open:** the deleted tab still shows until you press **Refresh**. If you edit or add on it before then, you get the message “Tab not found or not allowed” and nothing is saved. After Refresh it is gone, and if it was the tab you were viewing, the page moves to the first tab.

- **All tabs deleted:** if every visible, non-excluded tab is deleted, the page shows "No tabs available". Add one back and it recovers.
- **Renamed tab:** this behaves like a delete plus a new tab. A page opened before the rename gets "Tab not found" on edits until you refresh. The only code that looks up tabs by name is the `LAYOUTS` and `EXCLUDE_TABS` settings in the script. If you rename `Credential`, `webapp` or `vaccinator code`, update `EXCLUDE_TABS` to the new name, otherwise that tab will be sent to the page.
- **Deleting the whole spreadsheet:** this does break the app, because the script is attached to that spreadsheet. It would also stop working if you deleted the Apps Script project or its deployment.

The data in a deleted tab is lost from the sheet, but you can get it back:

- Press Ctrl+Z straight away, or
- Open File → Version history → See version history, and restore an earlier version.

To prevent accidents, you can use Data → Protect sheets and ranges on each tab so only you can delete it. The web app has no delete option, so tabs can only be removed from the Google Sheet itself.

thank you . i have developed most useful app with your generous help

You're welcome, I'm glad it's working for you.

Some small things to do now that it's in use:

- **Passcode:** set `ACCESS_CODE` in the Apps Script, especially for the FMD app with the Aadhaar numbers.
- **Backup:** make a copy of the Google Sheet now and then (File → Make a copy). The apps can edit data but have no undo, so a copy is a safe fallback.
- **Redeploy:** after any change to the `.gs` file, deploy it as a new version, or the web app keeps running the old code.
- **Web app URL:** keep it private. Anyone who has it can use the app.

If you want more features later, such as deleting rows, sorting columns or exporting to Excel, just ask.

i want to export entire this chat along with files

Ran 3 commands, shared files ▸

I can't export the chat's text from here, but I've put all the app files into one zip, `chat_export_apps.zip`. It also has a short `CHAT_SUMMARY.md` that describes each app and the steps to deploy it.

The zip has three folders:

- `1_medicine-stock`: the medicine stock app with the Del button removed.
- `2_fmd-microplan`: the FMD app with search, edit, and add ear tag.
- `3_vd-horala-charge-list`: the multi-tab app with search across all tabs.

I rebuilt the medicine stock `script.js` for the zip. An earlier file I made had overwritten it in my working folder, so I redid the Del removal on your original upload. It is a fresh copy and I haven't re-tested it.

Your original uploads (the xlsx files and the old `.gs`) aren't in the zip, since you already have them.

For the chat itself, a few options:

- **Copy it:** select and copy the conversation text into a document.
- **Print it:** use your browser's Print → Save as PDF.
- **Account export:** Claude's settings may have a data export for all your conversations, usually under Settings → Privacy. I'm not sure of the exact menu name, so check it in the app.
